

Voice control mechanical dog multi-point navigation

Quick use

1. Power on DOGZILLA

First, we turn on the switching power supply of the mechanical dog and start the mechanical dog

After starting, we can view the IP address on the small screen of the robot dog.

2. Start DOGZILLA chassis

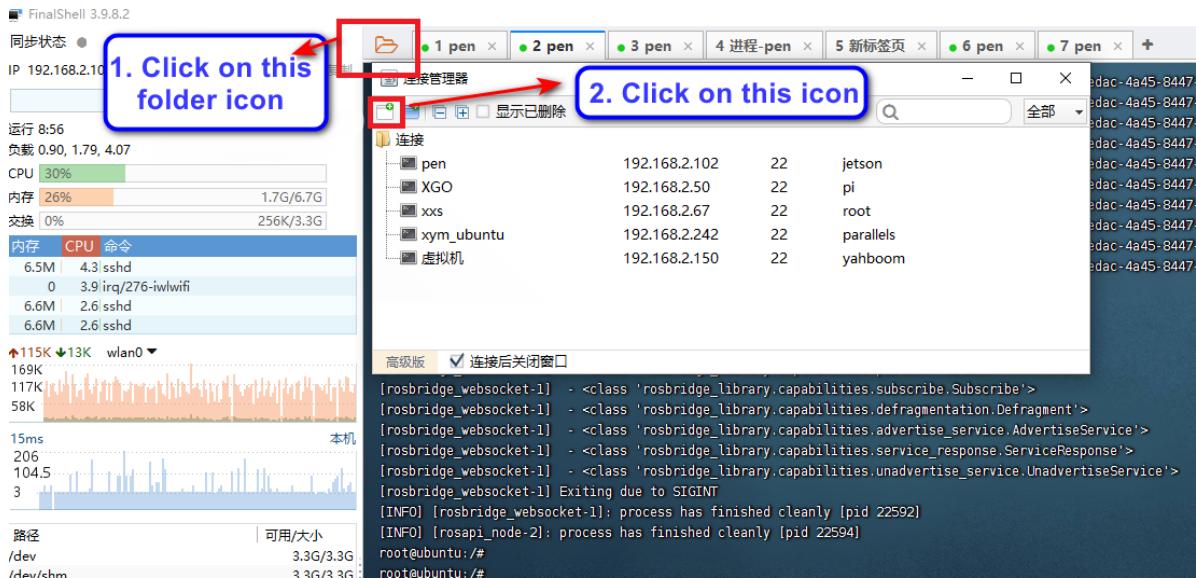

PI4 version steps:

For multi-machine communication ID modification, please refer to the tutorial: 14. Radar mapping navigation\6. Obtaining the status of the mechanical dog in the ROS2 environment\Acquiring the real joint data of the mechanical dog in the ROS2 environment.pdf

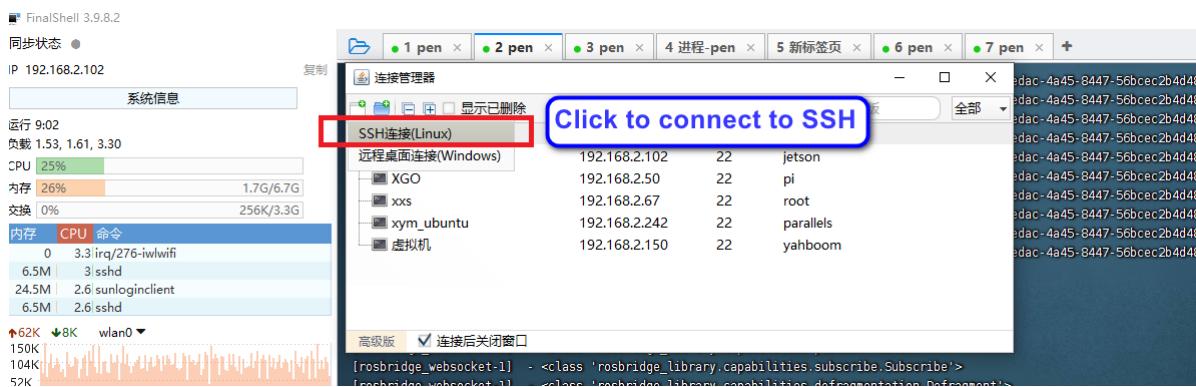

Then use the ssh terminal to connect to the robot dog.

Note: The IP address used when writing this tutorial: 192.168.2.102 User name: pi Password: yahboom The actual IP address shall prevail when used.

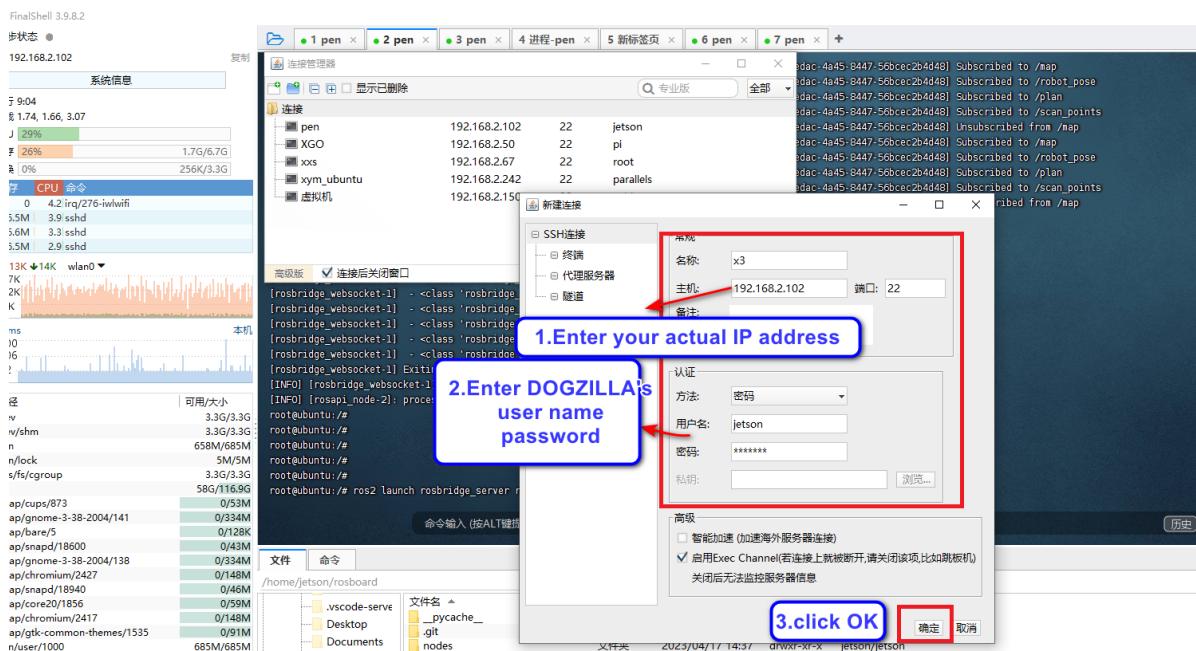

Open the shell tool. The shell tool I use here is FinalShell. Enter username, password, port, connection name and other information.

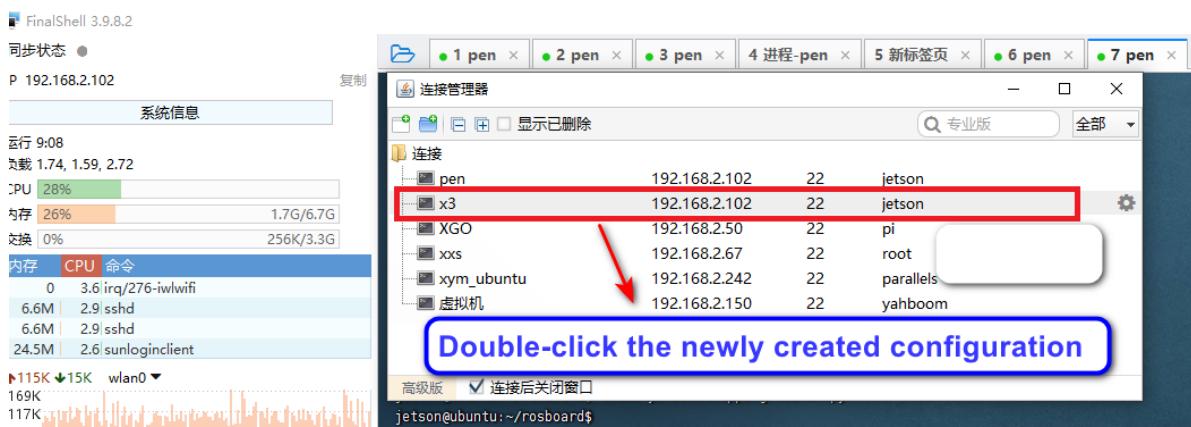

Select ssh connection to create a new ssh connection

Here the username is pi, the password is yahboom, and the ip address is the IP address of the real robot dog.

Select the ssh connection you just created here.

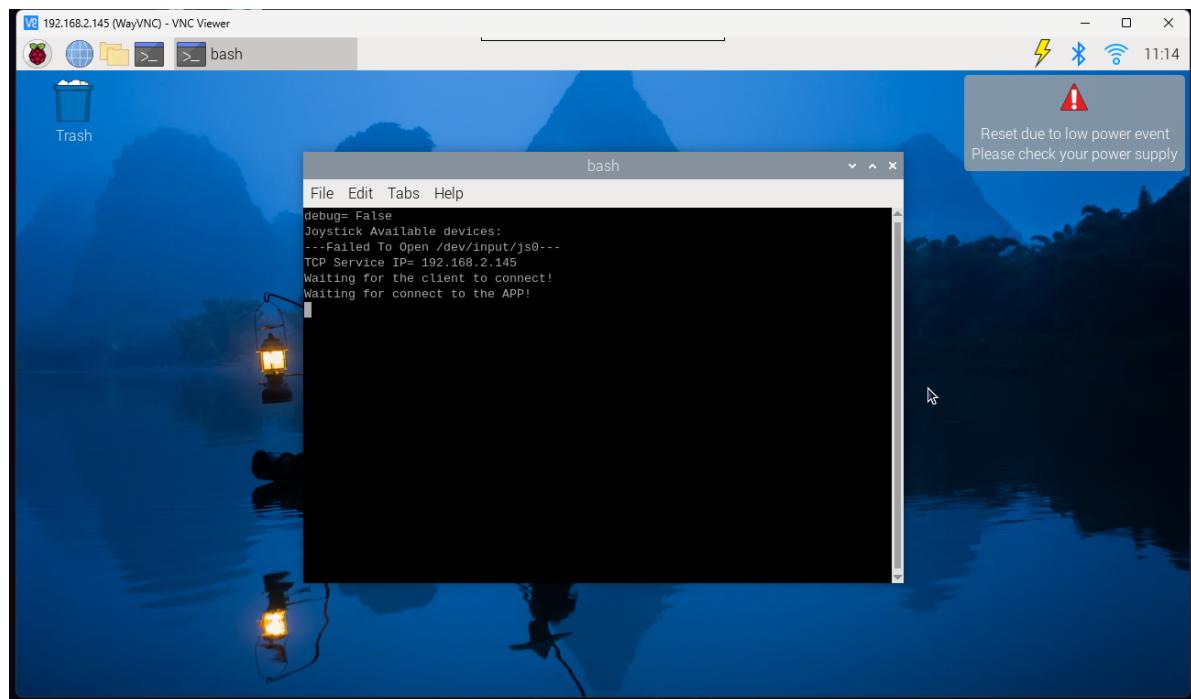

Then enter the command in the terminal to start the chassis task.

```
sudo systemctl restart YahboomStart.service
```

```
pi@yahboom:~$  
pi@yahboom:~$  
pi@yahboom:~$  
pi@yahboom:~$  
pi@yahboom:~$ sudo systemctl restart YahboomStart.service [
```

PI5 version steps:

After the mechanical dog is started, use the vnc software to remotely connect to the mechanical dog through the IP address on the OLED (**For specific steps, please see "Remote Login Operation"**).

Then **ctrl+c** closes the large program and enter the following command to enter docker:

```
./run_humble.sh
```

```
TCP Service IP= 192.168.2.145
Waiting for the client to connect!
Waiting for connect to the APP!
^CKeyboardInterrupt
2024-04-28T10:17:27Z
-----program end-----
pi@raspberrypi:~ $ ./run_humble.sh
access control disabled, clients can connect from any host
root@raspberrypi:/#
```

Then enter the following commands in the docker terminal to start the car radar, imu, and mechanical dog joint status nodes.

```
ros2 launch bringup Navigation_bringup.launch.py
```

```
root@raspberrypi: /
```

```

3. Start the navigation program

PI4 version steps:

Open the virtual machine and enter the user name yahboom and the password yahboom.

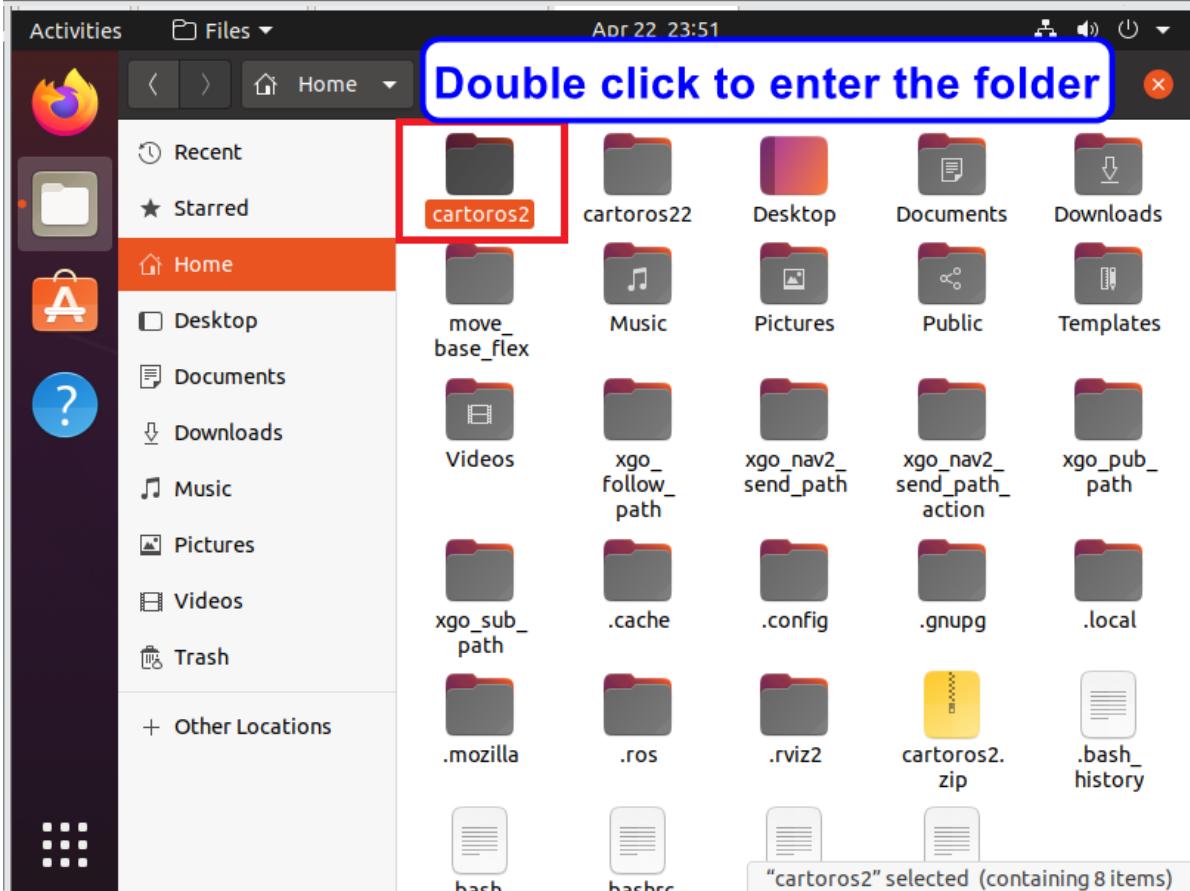

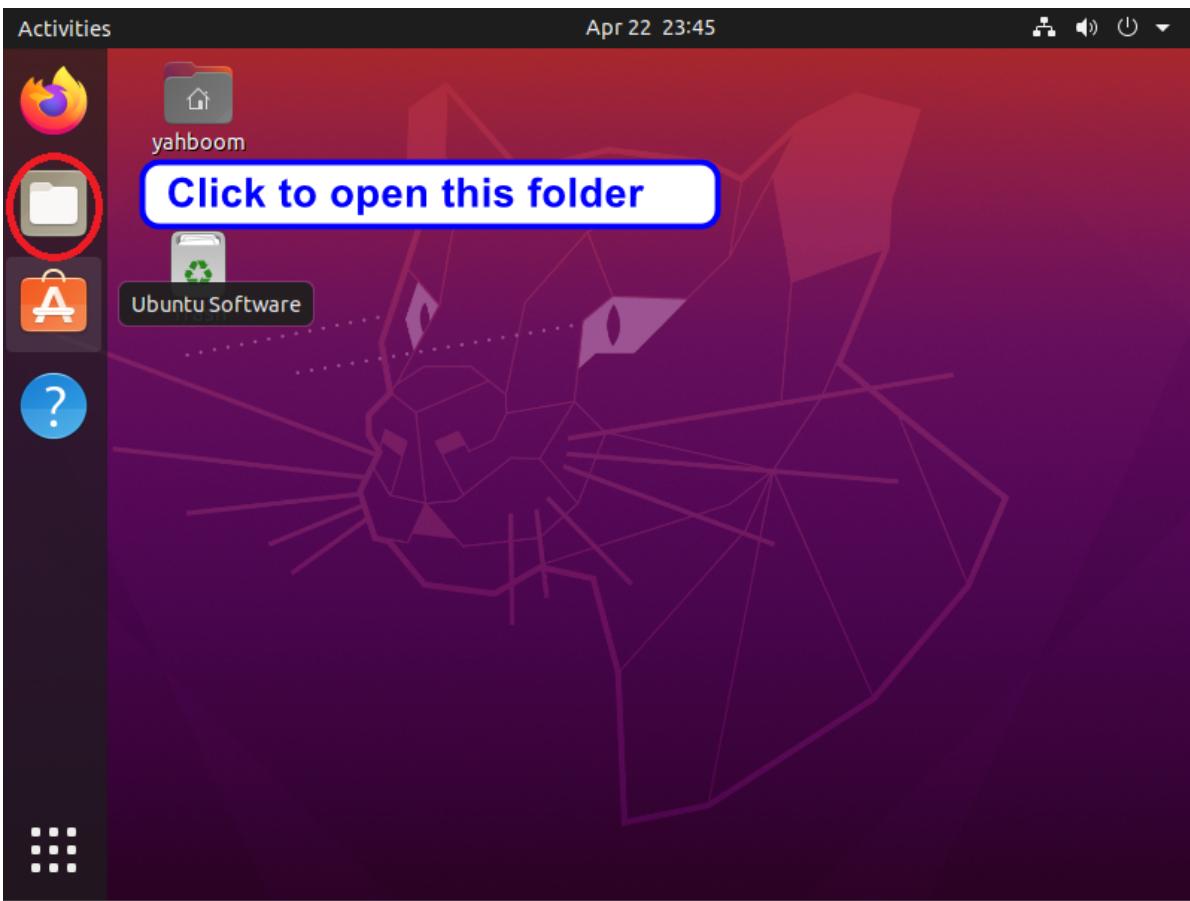

yahboom

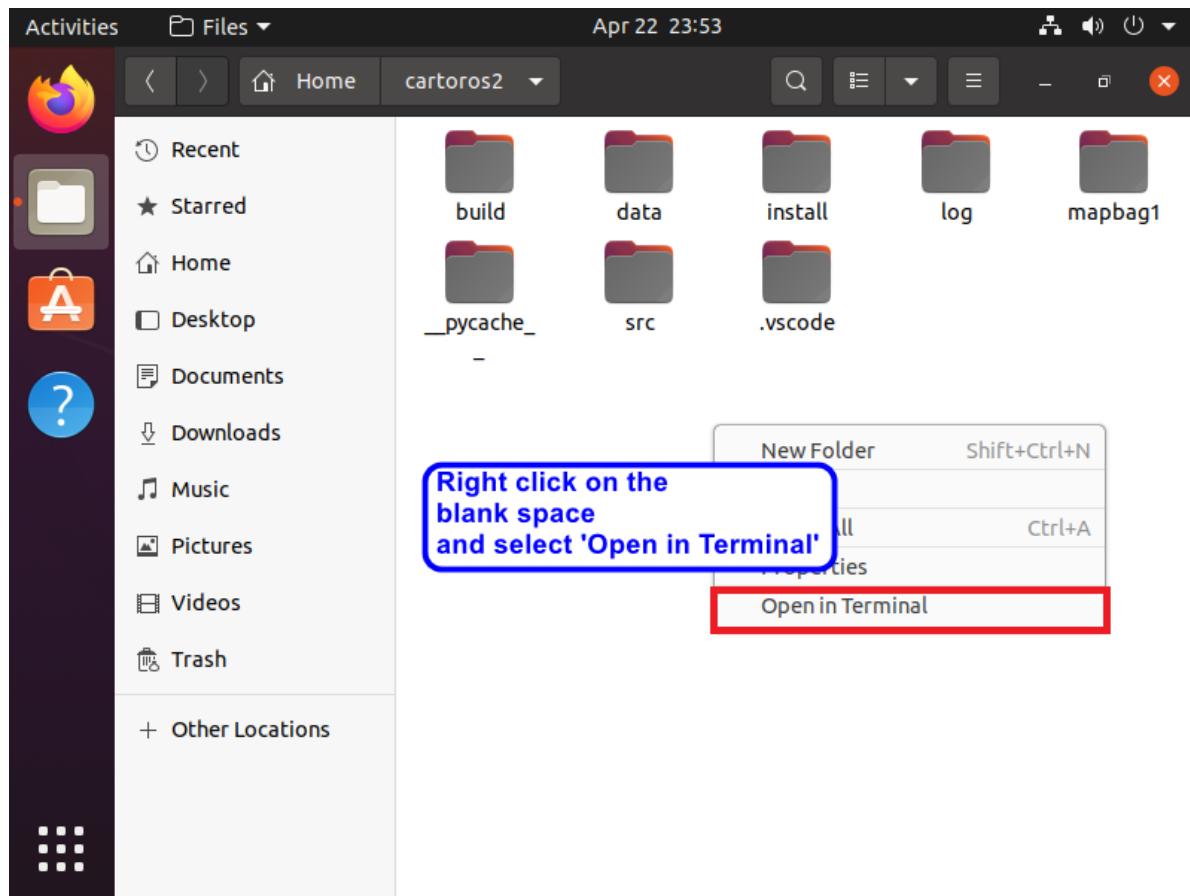

yahboom| ⑥

Click on the folder to open the cartoros2 folder.

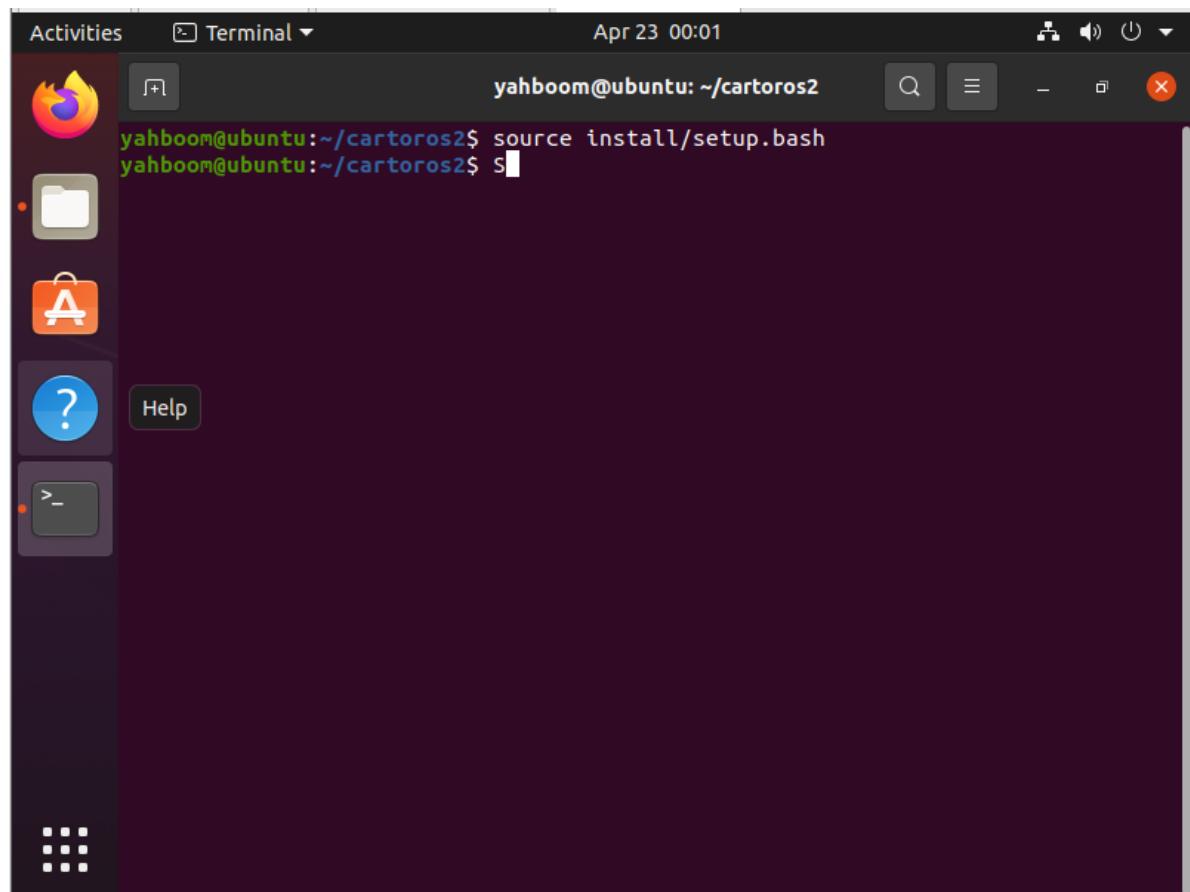

Open the terminal under the folder

Then enter the following command

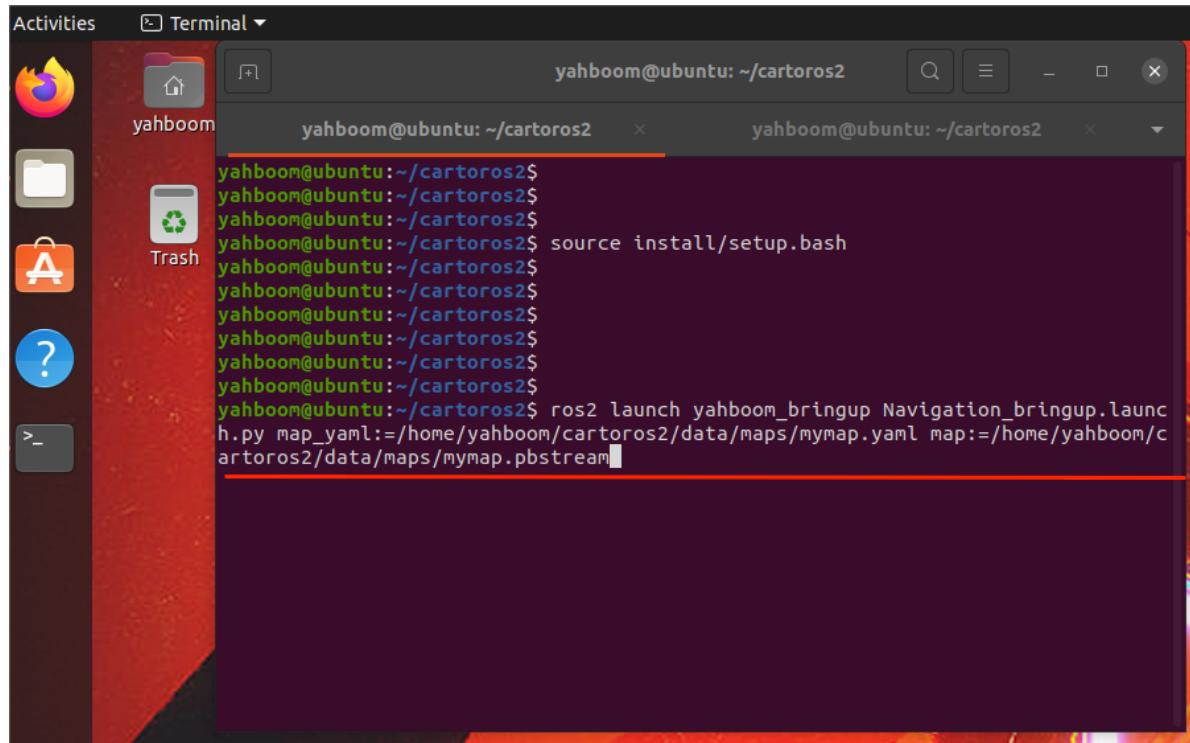

```
source install/setup.bash
```

Then start the navigation program, which is to first place the mechanical dog at the origin of the mapping. Then enter the command in the virtual machine terminal:

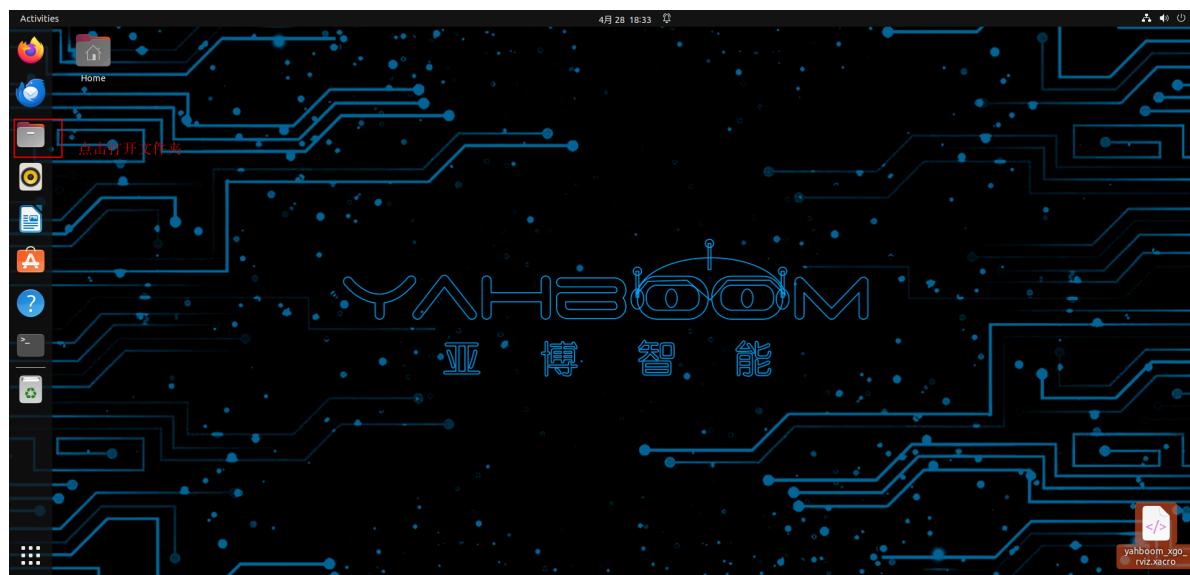

```
ros2 launch yahboom_bringup Navigation_bringup.launch.py  
map_yaml:=/home/yahboom/cartoros2/data/maps/mymap.yaml  
map:=/home/yahboom/cartoros2/data/maps/mymap.pbstream
```

Note: The map files xxx.yaml and xxx.pbstream here are the two files we saved in the previous mapping tutorial.

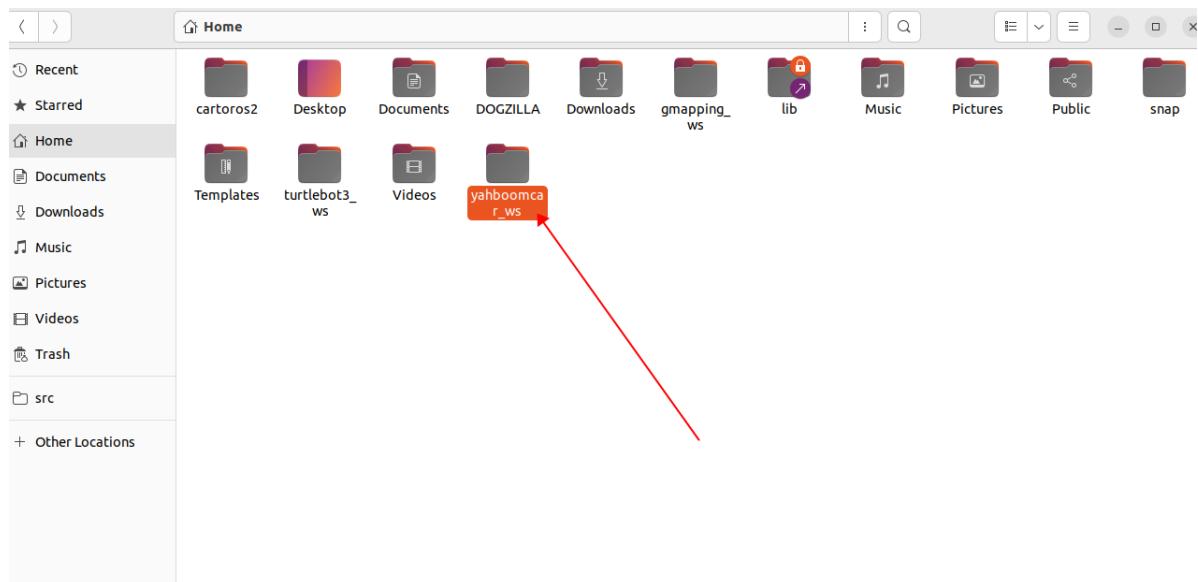

PI5 version steps:

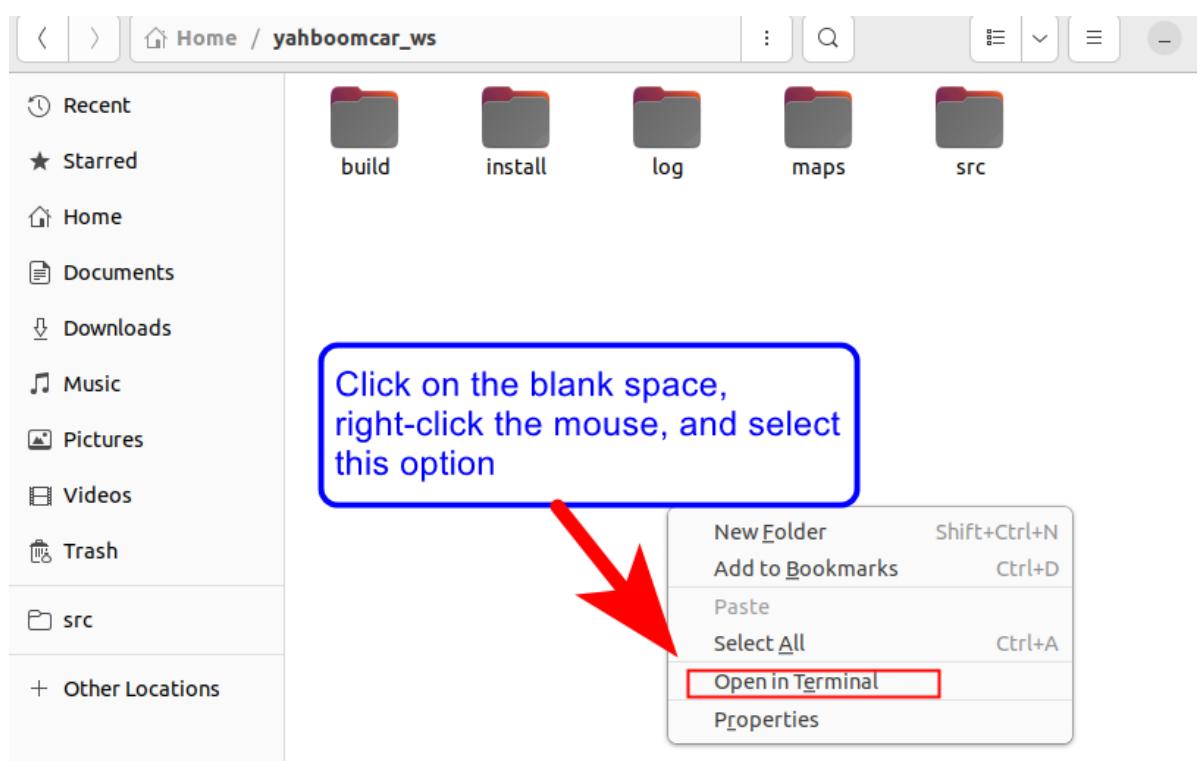

Enter the desktop system and open the folder.

Double-click to open the yahboomcar_ws folder

Then right-click in an empty space of the folder and select Open in Terminal

Then enter the following command in the terminal to activate the environment

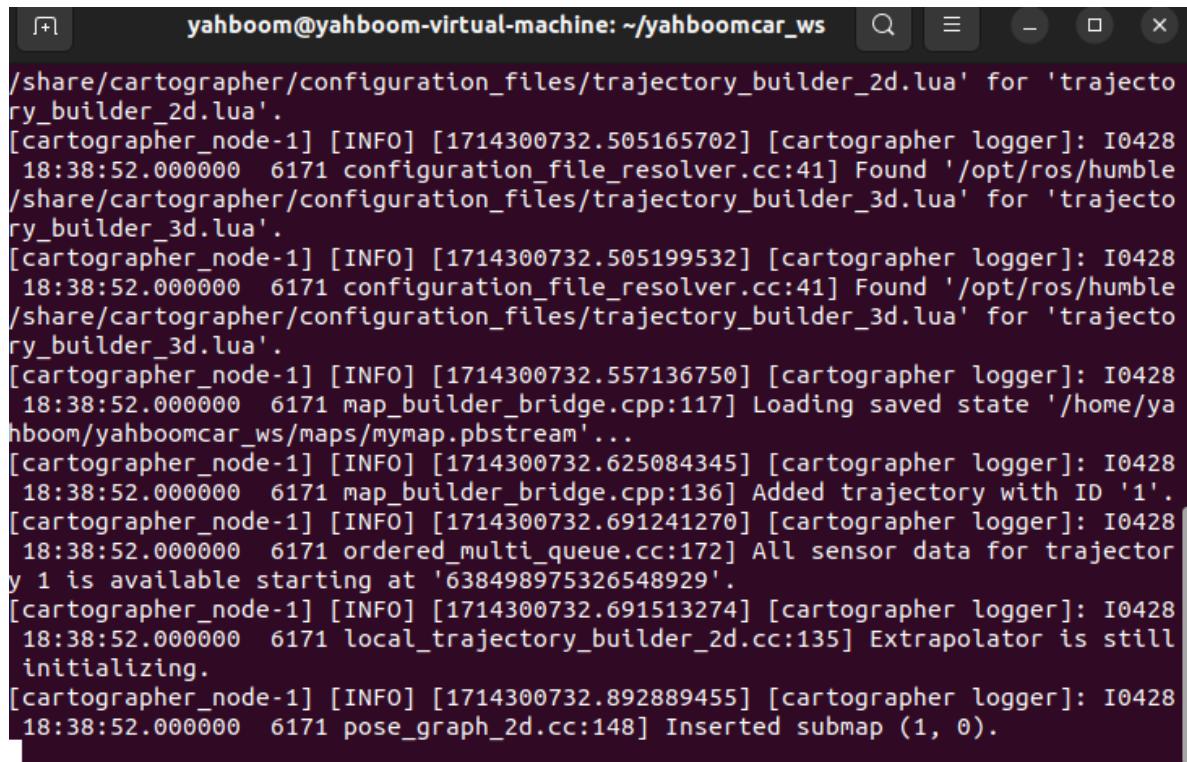

```
source install/setup.bash
```

After completing the input, press Enter.

```
yahboom@yahboom-virtual-machine:~/yahboomcar_ws$ source install/setup.bash
yahboom@yahboom-virtual-machine:~/yahboomcar_ws$
```

Then enter the command to start the relocation function

```
ros2 launch yahboom_dog_cartographer localization_imu_odom.launch.py  
load_state_filename:=~/home/yahboom/yahboomcar_ws/maps/mymap.pbstream
```

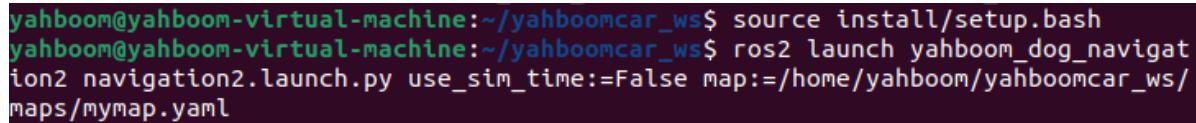

A terminal window titled "yahboom@yahboom-virtual-machine: ~/yahboomcar_ws". The log output shows the Cartographer node loading configuration files, finding trajectory builder scripts, loading a saved state from a pbstream file, adding a trajectory with ID '1', and inserting a submap (1, 0). The log entries are timestamped at 18:38:52.000000.

```
/share/cartographer/configuration_files/trajectory_builder_2d.lua' for 'trajectory_builder_2d.lua'.

18:38:52.000000 6171 pose_graph_2d.cc:148] Inserted submap (1, 0).
```

Repeat the above steps to open the terminal, reopen a terminal and enter navigation commands.

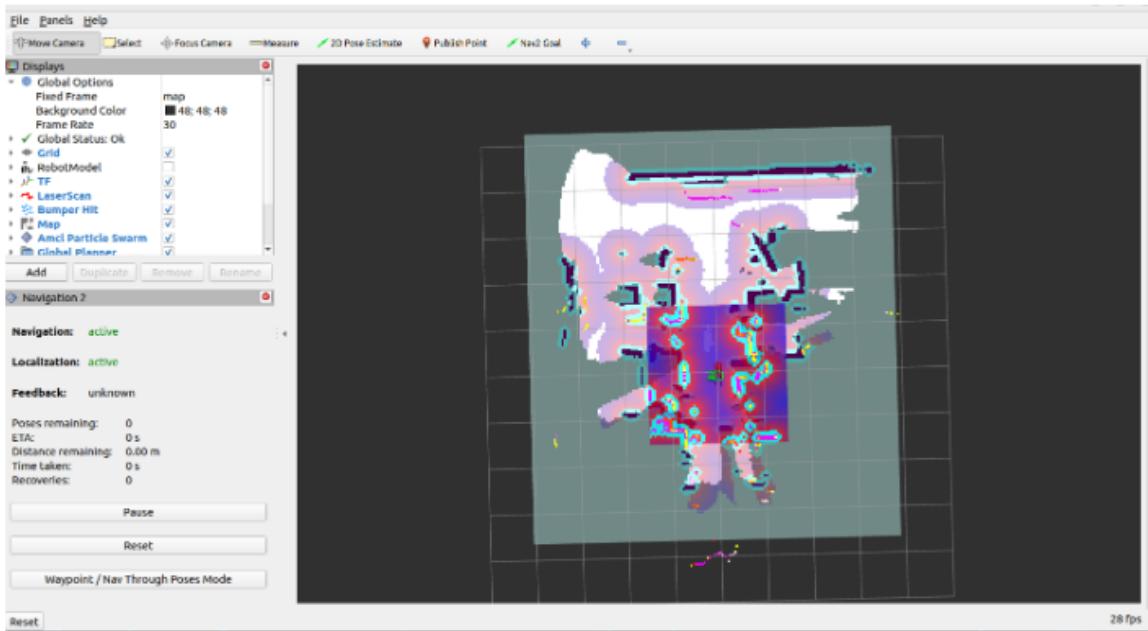

```
ros2 launch yahboom_dog_navigation2 navigation2.launch.py use_sim_time:=False  
map:=~/home/yahboom/yahboomcar_ws/maps/mymap.yaml
```

A terminal window titled "yahboom@yahboom-virtual-machine: ~/yahboomcar_ws\$". It shows the source command for setup.bash and then the execution of the navigation2.launch.py script with use_sim_time set to False and the map loaded from mymap.yaml.

```
yahboom@yahboom-virtual-machine:~/yahboomcar_ws$ source install/setup.bash
yahboom@yahboom-virtual-machine:~/yahboomcar_ws$ ros2 launch yahboom_dog_navigation2 navigation2.launch.py use_sim_time:=False map:=~/home/yahboom/yahboomcar_ws/maps/mymap.yaml
```

Then press the Enter key to navigate. (**Because the mechanical dog itself does not provide odom, we need to position the mechanical dog at the coordinate origin when constructing the map**)

4. Multi-point navigation node startup

The steps are the same for PI4 and PI5 versions:

After the navigation module is started, we open a terminal and start the multi-point navigation node. Enter the command in the newly opened terminal:

```
cd ~/cartoros2
```

```
source install/setup.bash
```

```
ros2 run xgo_nav2_send_goal xgo_nav2_send_goal
```

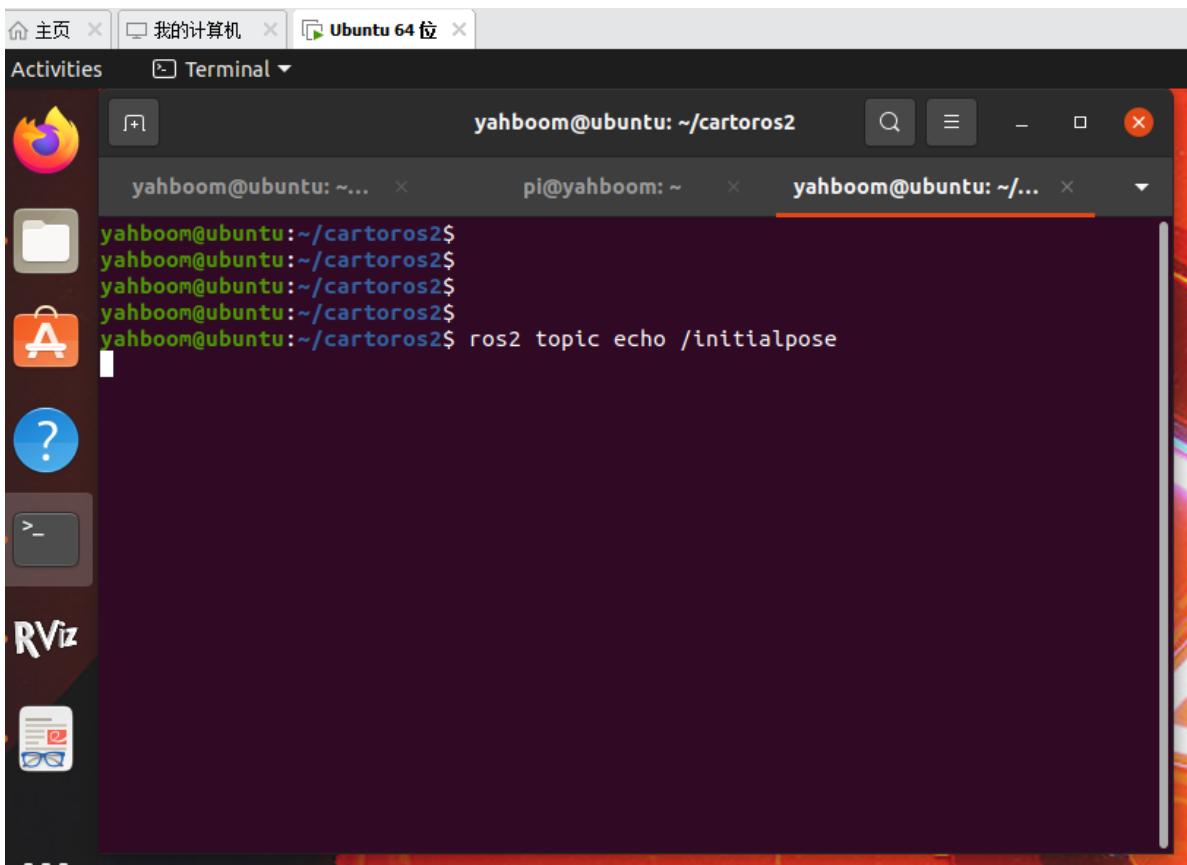

```
shboom@ubuntu:~/cartoros2$ cd ~/cartoros2
shboom@ubuntu:~/cartoros2$ source install/setup.bash
shboom@ubuntu:~/cartoros2$ ros2 run xgo_nav2_send_goal xgo_nav2_send_goal
```

5. Obtaining the navigation point position

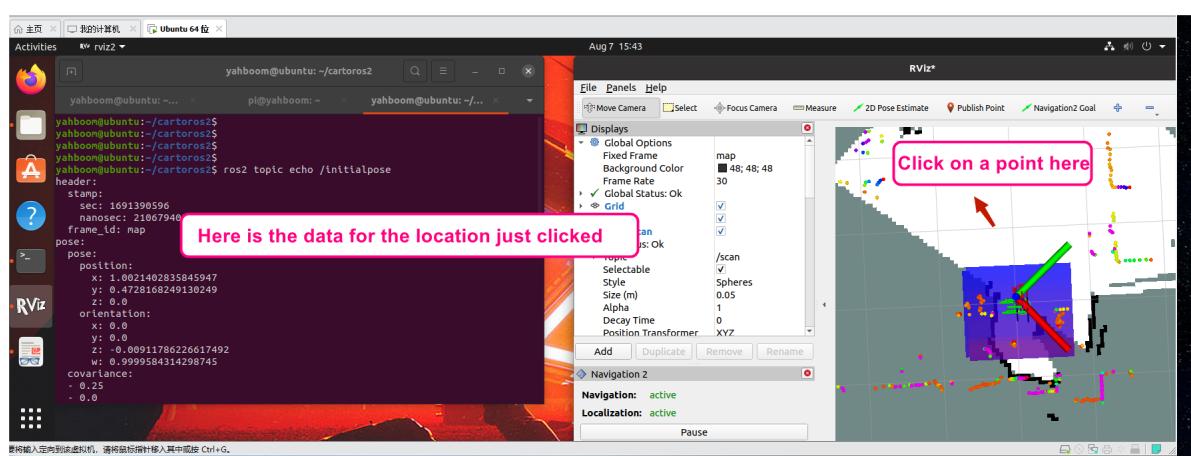

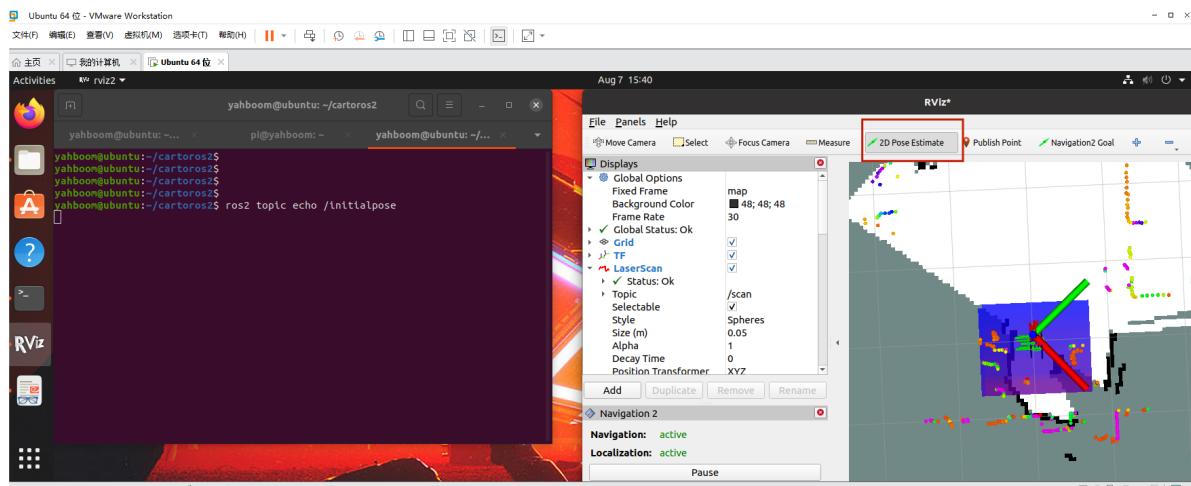

The steps are the same for PI4 and PI5 versions:

In the virtual machine terminal, press the shortcut key: **ctrl + alt + T** to reopen a terminal and subscribe to the `/initialpose` topic in the terminal to obtain the points we set in rviz. The command is as follows:

```
ros2 topic echo /initialpose
```

Click the button "2D Pose Estimate" in rviz and click a point on the map where you can walk. At this time, the location of the point just clicked will be printed in the terminal.

6. Voice navigation point modification

PI4 version steps:

According to the second step, open a new shell terminal, connect to the mechanical dog, and open the file in the path below.

```
#pi4  
/home/pi/cartographer_ws2/install/voice_xgo_ctrl_run/lib/python3.8/site-  
packages/voice_xgo_ctrl_run
```

The screenshot shows a terminal window with the following command history and file tree:

```
pi@yahboom:~/cartographer_ws2/src$  
pi@yahboom:~/cartographer_ws2/src$  
pi@yahboom:~/cartographer_ws2/src$  
pi@yahboom:~/cartographer_ws2/src$  
pi@yahboom:~/cartographer_ws2/src$ cd ../  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$  
pi@yahboom:~/Cartographer_ws2$
```

File tree (left sidebar):

- Cartographer_ws2
- install
- voice_xgo_ctrl_run
- lib
- python3.8
- site-packages
- voice_xgo_ctrl_run
- __pycache__

Code editor (right pane):

```
C:\Users\Admin\AppData\Local\finalshell\temp\edit\xgo2_voice_xgo_ctrl_mutl_goal.py  
文件 搜索  
xgo2_voice_xgo_ctrl_mutl_goal.py ×

go_ctrl_run  
  
python3.8  
  site-packages  
    voice_xgo_ctrl_run  
      __pycache__  
      Find this file
```

The code editor shows the file `xgo2_voice_xgo_ctrl_mutl_goal.py` with several lines of Python code. A red box highlights the line `if command_result==19:`. Below the code editor, a pink button says "Find this file".

Then we modify the annotated part and modify the corresponding position.x, position.y, position.z, orientation.x, orientation.y, orientation.z.orientation.w values according to the data subscribed to rviz. As shown below:

```
self.goal_pose.pose.position.x = 1.5891228914260864  
self.goal_pose.pose.position.y = -0.6004130840301514  
self.goal_pose.pose.orientation.x = 0.0  
self.goal_pose.pose.orientation.y = 0.0  
self.goal_pose.pose.orientation.z = -0.7115524476991484  
self.goal_pose.pose.orientation.w = 0.7026329868240964
```

The terminal window shows the output of a ROS command:

```

[yahboom@ubuntu:~... pi@yahboom:~]
yahboom@ubuntu:~/catkin_ws$ ros2 topic echo /in
header:
  stamp:
    sec: 1691390596
    nanosec: 210679405
    frame_id: map
pose:
  position:
    x: 1.0021402835845947
    y: 0.4728168249130249
    z: 0.0
  orientation:
    x: 0.0
    y: 0.0
    z: -0.00911786226617492
    w: 0.9999584314298745
covariance:
  - 0.25
  - 0.0

```

The code editor shows the Python script 'xgo2_voice_xgo_ctrl_mutl_goal.py' with several lines highlighted in red:

```

19 from Speech_Lib import Speech
20
21
22 class VoiceCtrlsendGoal(Node):
23     def __init__(self):
24         super().__init__("voice_ctrl_publisher")
25         self.publisher = self.create_publisher(PoseStamped, '/voice_command', 10)
26         self.timer = self.create_timer(0.1, self.send_pose)
27         self.x = 0.0
28         self.z = 0.0
29         self.goal_pose = PoseStamped()
30         self.spe = Speech()
31
32     def send_pose(self):
33         command_result = self.publisher.publish(self.goal_pose)
34
35         if command_result == 20:
36             # 导航去1点
37             self.goal_pose.header.frame_id = "map"
38             self.goal_pose.pose.position.x = 1.5891228914260864
39             self.goal_pose.pose.position.y = -0.6004130840301514
40             self.goal_pose.pose.orientation.x = 0.0
41             self.goal_pose.pose.orientation.y = 0.0
42             self.goal_pose.pose.orientation.z = -0.7115524476991484
43             self.goal_pose.pose.orientation.w = 0.7026329868240964
44             self.publisher.publish(self.goal_pose)
45
46         if command_result == 21:
47             self.goal_pose.header.frame_id = "map"
48             self.goal_pose.pose.position.x = 1.6686009006500244
49             self.goal_pose.pose.position.y = -2.130525588989258
50             self.goal_pose.pose.orientation.x = 0.0
51             self.goal_pose.pose.orientation.y = 0.0
52             self.goal_pose.pose.orientation.z = 0.9999927524784346
53             self.goal_pose.pose.orientation.w = 0.0038072287302516462
54             self.publisher.publish(self.goal_pose)
55

```

A pink box with the text "Note: It is to modify the assignment of variables" has arrows pointing to the highlighted lines.

We can see that there are 5 points, but we only need to modify 4 according to the above method, because the fifth point is the origin position.

PI5 version steps:

According to the method in the second step, enter the same docker terminal** (you can see the previous steps to enter the same docker step)**, enter the following command to open,

```

#path
cd yahboomcar_ws/install/voice_xgo_ctrl_run/lib/python3.10/site-
packages/voice_xgo_ctrl_run
#Open the modified file
vi voice_xgo_ctrl_mutl_goal.py

```

```

vi editor operation: After opening the file, enter i to start editing. After editing is completed, press ESC, then enter: wq to save and exit the file!

5. Start voice control multi-point navigation node

The steps are the same for PI4 and PI5 versions:

Open another shell or docker terminal and enter the following command in the terminal:

Notice: This terminal is the terminal that opens the remote connection to the mechanical dog.

```
#pi4
cd ~/cartographer_ws2/
source install/setup.bash
ros2 run voice_xgo_ctrl_run voice_xgo_ctrl_mult_goal

#pi5
cd yahboomcar_ws/
source install/setup.bash
ros2 run voice_xgo_ctrl_run voice_xgo_ctrl_mult_goal
```

```

pi@yahboom:~/cartographer_ws2$ 
pi@yahboom:~/cartographer_ws2$ 
pi@yahboom:~/cartographer_ws2$ 
pi@yahboom:~/cartographer_ws2$ 
pi@yahboom:~/cartographer_ws2$ cd ~/cartographer_ws2/
pi@yahboom:~/cartographer_ws2$ source install/setup.bash
pi@yahboom:~/cartographer_ws2$ ros2 run voice_xgo_ctrl_run
--prefix
voice_xgo_ctrl_action
voice_xgo_ctrl_color_identify
voice_xgo_ctrl_color_identify\=\ voice_xgo_ctrl_run.voice_xgo_ctrl_color_identify:mainvoice_xgo_ctrl_mult_goal
voice_xgo_ctrl_mult_goal
voice_xgo_ctrl_mutl_goal_identify
voice_xgo_ctrl_run
pi@yahboom:~/cartographer_ws2$ ros2 run voice_xgo_ctrl_run voice_xgo_ctrl_mult_goal
Speech Serial Opened! Baudrate=115200

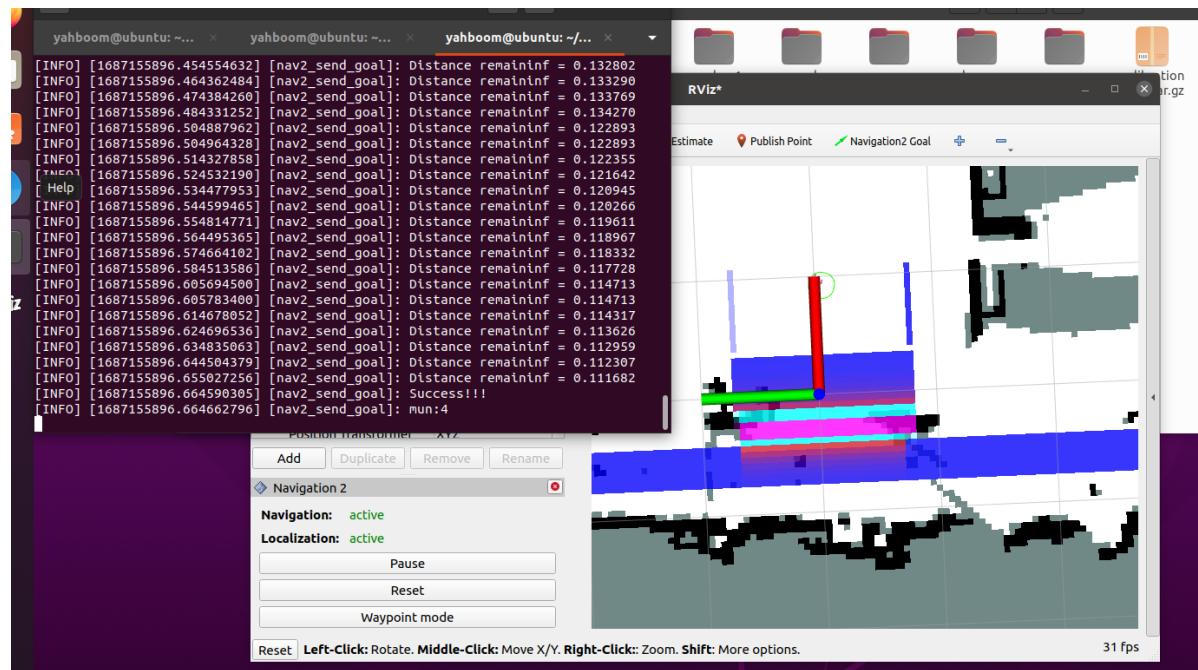

```

Then he said to the mechanical dog: "Hello, Xiaoya"

The mechanical dog replied: "Yes"

Then say to the mechanical dog: "" Navigate to position 1

As shown in the picture below, the mechanical dog will automatically navigate to position 1.

The internal commands of the mechanical dog include: navigate to position 1, navigate to position 2, navigate to position 3, navigate to position 4 and other voice navigation commands.
